/// Plug-in voltage monitoring railway relay with 4 C/O contacts

Rugged plug-in relays for extreme reliability, within long endurance applications and harsh environments

CMVD4-U200N

Customizable voltage monitoring, timer delay-on/off relay

Part of D-platform

Description

Plug-in electronic customizable voltage monitoring relay with optional delay-on and delay-off timer function and four change-over contacts for reliable switching of very low currents (1 mA @5 VDC) up to currents of 10 A @ 110 VDC. Fully customizable according customer's requirements concerning voltage monitoring type and timing diagram.

CMVD4 can provide multiple voltage thresholds (adjustable) for both pull-in and drop-out voltages with different timing delays. The relay can also be supplied with a fixed pull-in and drop-out voltage.

The delay times are also adjustable (either delay-on or delay-off, the other delay is fixed). The relay can also be supplied with symmetrical or asymmetrical flashing, 1-shot, 2-shot, 3-shot etc or with fixed time delays. A maximum of 3 parameters can be adjusted by means of 2 screws and 1 knob.

Suitable for monitoring DC voltages.

The CMVD4-U200N offers a very small hysteresis (difference between pull-in and drop-out voltage). The relay is equipped with one LED which indicates activation of the time delay (blinking light) and the status of the relay contacts (continuously ON or OFF). Delay-off function for voltage drop down to 50 % of minimum pull-in voltage, no auxiliary supply necessary.

The built-in magnetic arc blow-out ensures adequate DC breaking capacity resulting in long contact life. The integrated contact separation prevents cross pollution of contacts. On the relay cover the serial number and data matrix code are shown for ease of traceability.

The construction of the relay and choice of materials makes the CMVD4-U200N relay suitable to withstand low and high temperatures, shock & vibrating and dry to humid environments. No external retaining clip needed as integrated 'snap-lock' will hold relay into socket under all circumstances and mounting directions.

Features

- Customizable DC voltage monitoring relay with timer function
- Compact plug-in design
- 4 C/O contacts
- Multiple voltage thresholds for both pull-in and drop-out voltages, adjustable
- Also available with fixed voltages
- Very small hysteresis possible
- Time delay on any voltage thresholds
- Different customizable timing possible
- No auxiliary power supply necessary
- Also available with fixed time delays
- Time/pulse delay range: 0...60 s
- 1 LED for status indication, red or green
- Integrated back EMF suppression diode
- Minimum switching current 1 mA
- Maximum continuous current 10 A
- Wide temperature range -40 ºC...+70 ºC
- Mechanical life > 30 million operations
- Electrical life e.g. > 10 million operations at 0.5 A, 24 VDC
- Data matrix code with serial number for traceability
- Integrated snap-lock, no external retaining clip needed
- Transparent cover for visual inspection
- Many options and sockets available

Application

The CMVD4-U200N relay can be used in all demanding railway applications where non-standard voltage monitoring and timer functions are necessary.

Relays continue to play a vital role in reliable train operation. Key functions are galvanic isolation between control (computers/ PLC's) and power circuits providing system isolation, contact multiplication and amplification.

Other unique features are:

- predictable failure behavior (Fail Safe) making system safety validation a lot more simple than using computer based solutions like PLC's
- long term availability (no obsolescence)
- easy maintenance by plug-in feature and transparent cover
- unlike more sensitive electronics, relays are insensitive to EMI

Using these features one can build a hardwired, fail safe control system which is cyber secure and insensitive to electro magnetic disturbances and surges. Relays are ideal to use in trains for signal transfer/repeat, safety interlocking functions (brake - doors), load on-off switching and sub-system isolation.

Railway compliancy

CE

Voltage monitoring relay
CMVD4-U200N

Options

- Gold plated contacts
- IP50 dust protection (only for fixed voltage settings)
- AgSnO2 contacts, weld resistant for capacitive loads
- Double make/double break contacts
- Double zener diode
- Keying (coding relay to correct socket)

Remark: Not all combinations possible

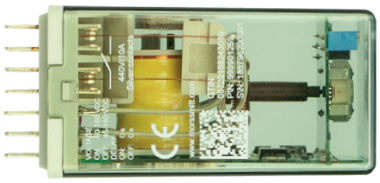
Weight

~ 145 g

Serializing

Each relay is marked with a unique serial number to which link important information and test results.

The GTIN (Global Trade Item Number) and part number are printed on each relay in both text and data matrix code according the worldwide recognized GS1 standard, being able to scan each relay for logistical and traceability purposes.



Sockets

		Mounting			
		Surface / Wall	35 mm rail	Panel / Flush	PCB
Terminal connection	Screw	V23	V23	-	-
	Screw - wide terminals	V22 BR	V23 BR	-	-

Voltage monitoring relay
CMVD4-U200N

Coil characteristics

Type	Drop-out Uadjustable (VDC)	Pull-in Uadjustable (VDC)	Current consumption (mA) monitoring only, relay switched off	Current consumption (mA) relay switched on
CMVD4-U201N	15-60	20-60	2	21
CMVD4-U202N	30-120	40-120	2.5	12
CMVD4-U204N	45-180	60-180	3	9
CMVD4-U213N	60-240	80-240	3.5	9
CMVD4-U215N	75-300	100-300	4	8

Other types on request
Remark: Maximum adjustable voltage is also the maximum allowable voltage, otherwise the relay can be damaged.

Example: CMVD4-U204N with drop-out voltage 95 VDC and pull-in voltage 110 VDC and:

Application voltage (VDC)	Current consumption (mA)	Power (W)
30	3	0.1
90	3	0.3
100*	3	0.3
100**	9	0.9
120	9	1.1

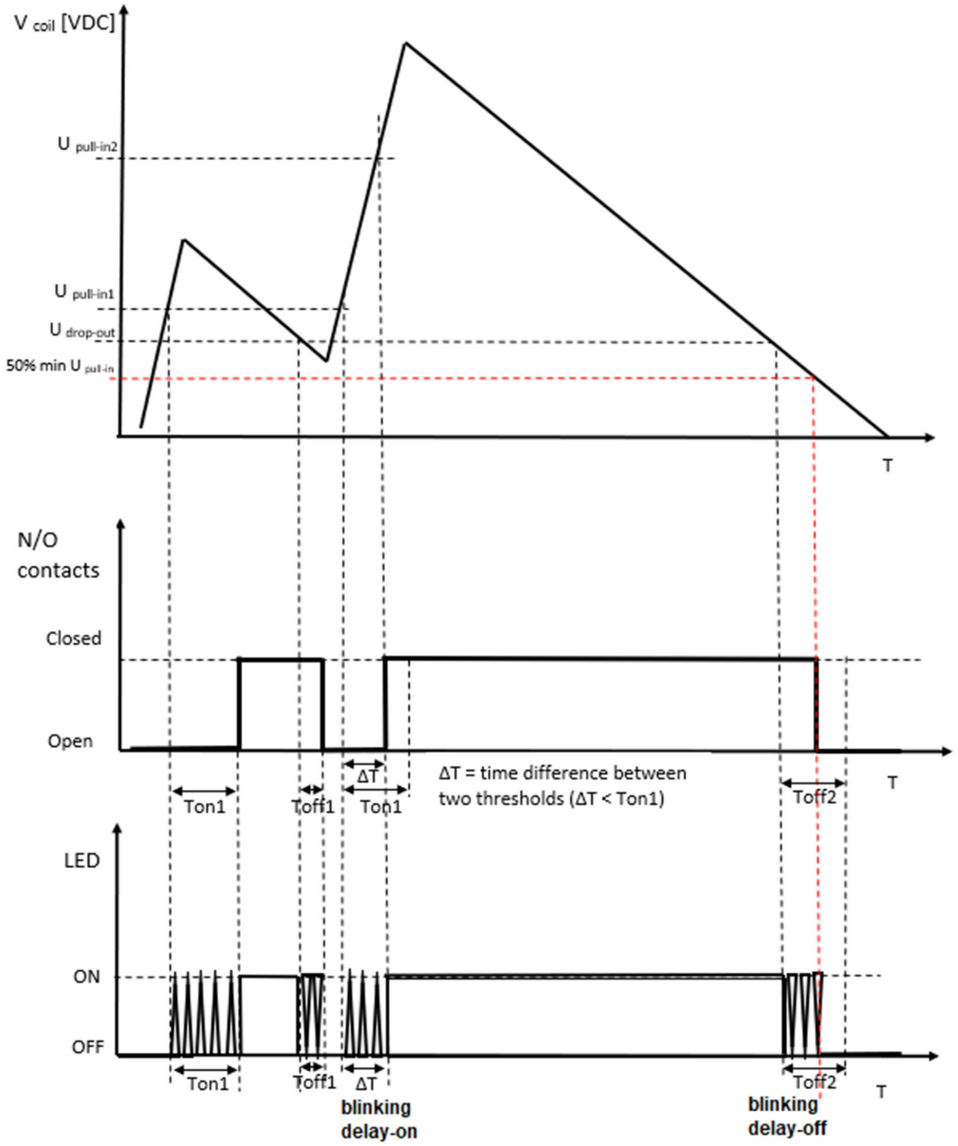
* Before relay has pulled in
** After relay has pulled in

Timing diagrams

Example 1:
Voltage monitoring relay is activated at Upull-in1 (threshold 1) with a delay-on Ton1. If the voltage is higher than Upull-in2 (threshold 2), the relay will switch on instantaneously.

The relay will drop out at Udrop-out. The first time with delay-off Toff1, the second time with delay-off Toff2. Then the cycle starts over again.

When the voltage drops down to 50% of the minimum pull-in voltage, the relays always drops-out instantaneously.

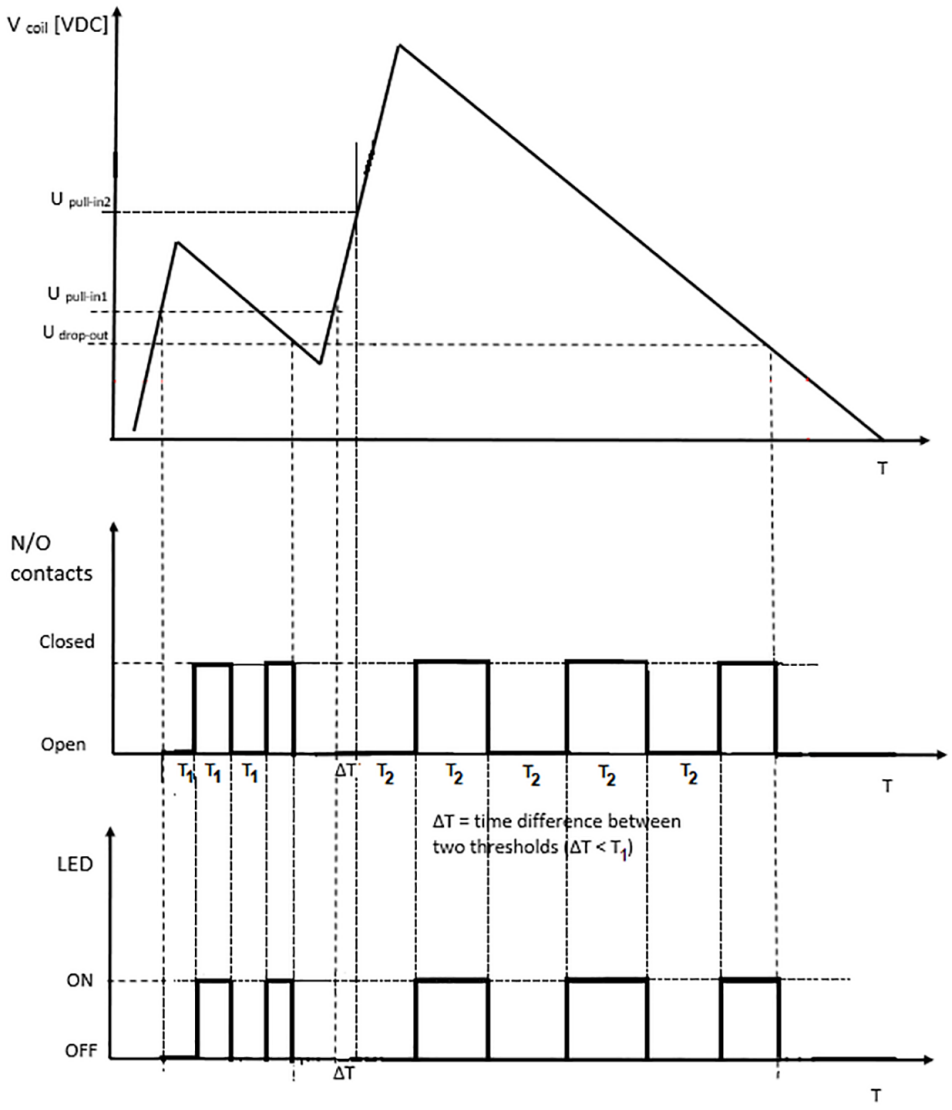


Timing diagrams presented are examples.
Different configurations possible.

Timing diagrams

Example 2.
Voltage monitoring relay is activated at Upull-in1 (threshold 1) with symmetrical flashing (T1) . If the voltage is higher than Upull-in2 (threshold 2), the relay will switch with symmetrical flashing (T2).

The relay will drop out at Udrop-out without time delay.

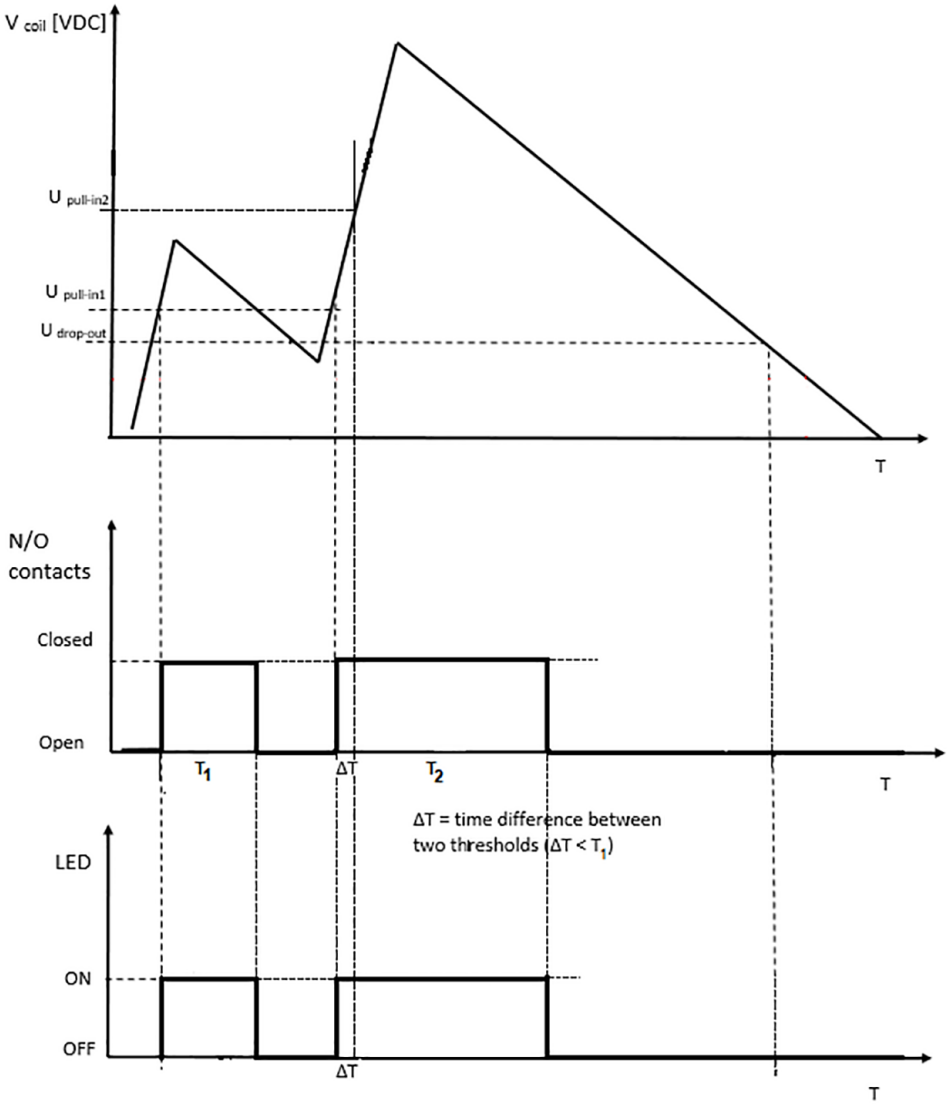


Timing diagrams presented are examples.
Different configurations possible.

Timing diagrams

Example 3:
At pull-in1 the N/O contacts will close as per pulse T1. If the voltage increases to pull-in2 pulse2 will overwrite pulse1. The length of the second pulse will be T2.

- If during pulse T1 or T2 the voltage drops below the pull-in voltage, the pulse remains.
- If during pulse T1 or T2 the voltage drops below the pull-in voltage but not below the drop-out voltage, and increases to the pull-in voltage within the pulse time, only the initial pulse remains.
- If during pulse T1 or T2 the voltage drops below the drop-out voltage, the relay will drop-out instantaneously and the relay is reset to the initial state.

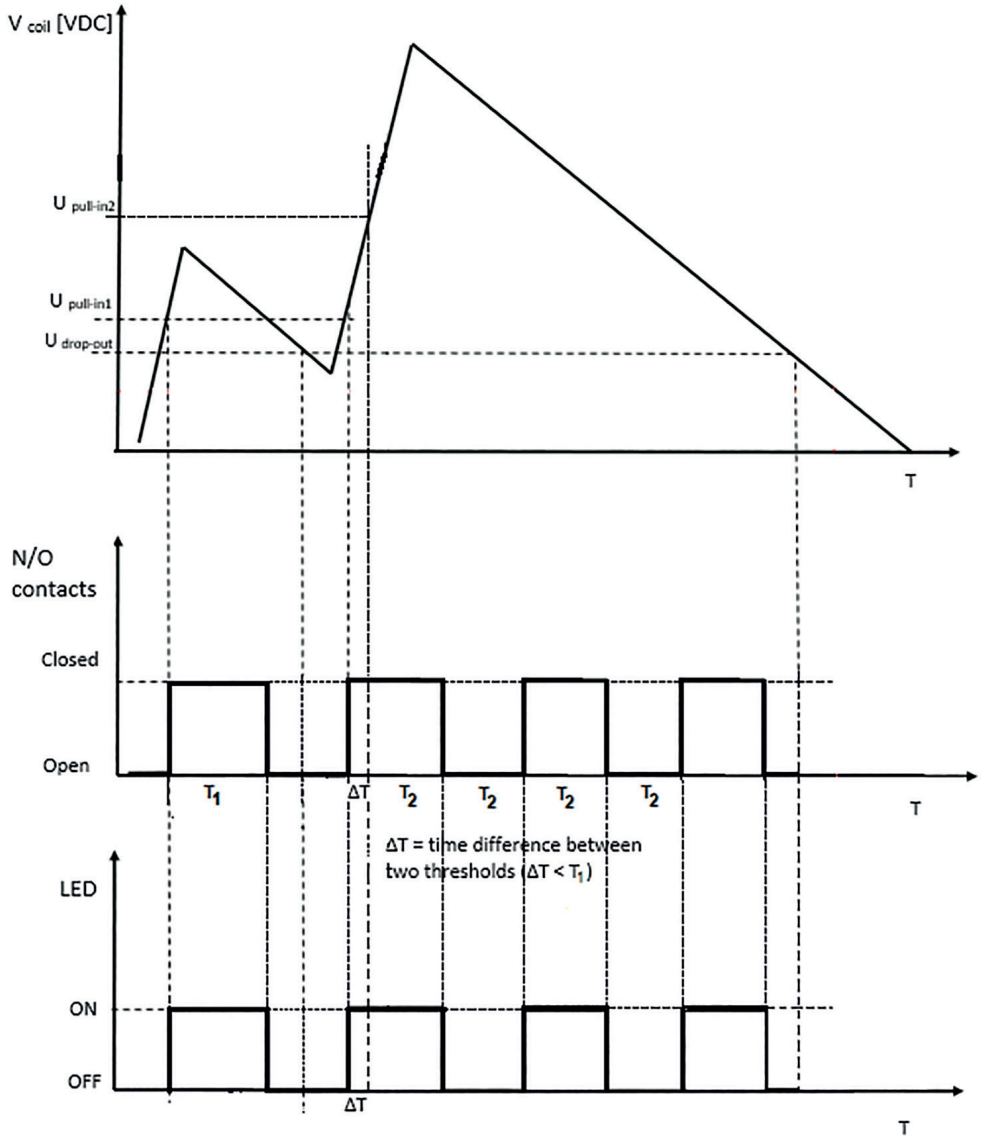


Timing diagrams presented are examples.
Different configurations possible.

Timing diagrams

Example 4:
At pull-in 1 the contacts will close as per pulse T1. If the voltage increases to pull-in2 symmetrical flashing starts with T2, which overwrites pulse 1.

- If during pulse T1 or T2 the voltage drops below the pull-in voltage, the pulse remains.
- If during pulse T1 or T2 the voltage drops below the pull-in voltage but not below the drop-out voltage, and increases to the pull-in voltage within the pulse time, only the initial pulse T1 or flashing pulse T2 remains.
- If during pulse T1 or T2 the voltage drops below the drop-out voltage, the relay will drop-out instantaneously and the relay is reset to the initial state.



Timing diagrams presented are examples.
Different configurations possible.

Technical specifications

Voltage monitoring relay
CMVD4-U200N

The hardware of CMVD4-U200N is the same as MTDV4-U200N relay. The difference consists in a different firmware customized for each special application.

Voltage characteristics

Voltage settings		Drop-out and pull-in both adjustable, or both fixed value. Multiple thresholds possible.
Minimal hysteresis		2 % x $U_{pull-in}$
Accuracy	Fixed voltages	Max. ± 0.25 % deviation
	Repeatability	Max. ± 0.5 % deviation
	Temperature variation	Max. ± 0.02 % / degree (compared to 20 ˚C)
Example Pull-in voltage set on 110.0 VDC. The ambient temperature is 40 °C which is 20 degrees different compared to the standard 20 °C. This results in 0.4 % extra voltage variation. The total maximum voltage variation is then 0.5 % (due to repeatability) + 0.4 % (due to temperature) = 0.9 %. In this case every pull-in voltage will be between 109.0 and 111.0 VDC.		

Contact characteristics

Contact configuration		4 C/O
Peak inrush current	NF F 62-002	200 A (withstand > 10 x 200 A @ 10 ms, 1 min) 80 A (withstand > 10 x 80 A @ 200 ms, 1 min) 40 A (withstand > 10 x 40 A @ 500 ms, 1 min) 30 A (withstand > 10 x 30 A @ 1000 ms, 1 min)
Maximum continuous current		10 A
Maximum switching voltage		250 VDC, 440 VAC
Minimum switching voltage*		5 V
Minimum switching current*		1 mA
Maximum breaking capacity (> 50.000 operations)		110 VDC, 10 A (resistive load) 72 VDC, 5 A (L/R ≤ 40 ms) 110 VDC, 0.5 A (L/R ≤ 40 ms)
Contact resistance		≤ 15 mΩ (initial) @ 5 ADC (Ag, $AgSnO_2$) & @ 10 mAAC (Au)
Material		Ag standard (optional $AgSnO_2$, Au on Ag)
Contact gap		0.7 mm
Contact force		> 200 mN

* Standard silver contacts tested in lab conditions. However we strongly advise to always use gold plated contacts when switching very low currents, as long time reliable operation depends also on switching frequency and environmental conditions. Take recommendations for long time reliability on page 15 into account.

Contact reliability according IEC 60947-5-4

Contact switching load	Contact material	Failure rate λ_c*	Mean number of operating cycles to contact failure m_c*
1 mA , 5 VDC resistive	Gold (option E)	$10x10^{-8}$	10.000.000
5 mA , 24 VDC resistive	Gold (option E)	$7.3x10^{-8}$	14.000.000
10 mA , 50 VDC resistive	Silver (standard)	$3.2x10^{-8}$	31.000.000

*at confidence level 90%

Note: tested in laboratory environment at ambient temperature 20 ºC. To underline the reliability of low current switching in parallel a 1 mA / 5 V test was done using standard silver contacts, resulting in the same reliability. But since real train conditions are far different from lab conditions we strongly advise gold plated contacts for such low contact ratings. Take recommendations for long time reliability on page 15 into account.

Voltage monitoring relay

Voltage monitoring relay
CMVD4-U200N

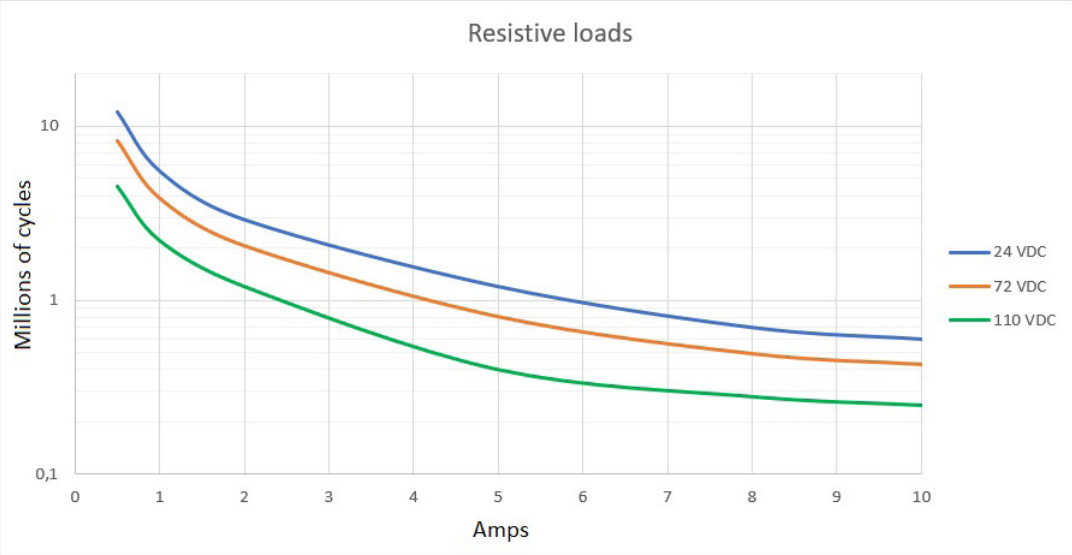
Options

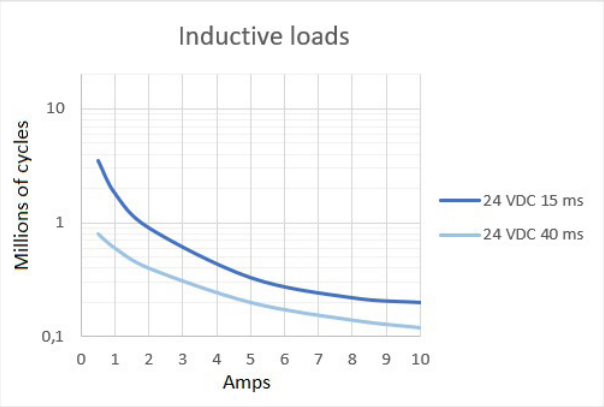
Code	Description	Remark	Cannot be combined with:
Standard options:			
E*	Au; Gold plated contacts		M
K	Extra dust protection	Only for fixed voltage settings. IP50 Cat 2 for the relays mounted in a Mors Smitt socket. Application PD1/PD2 and contact load > 0.5 A.	
Lr	Red LED indicator	Standard included	
Q	Double zener diode over coil	Only for U201, U202 and U204 versions: Maximum allowed peak voltage 180 V, higher voltage will damage the diode.	
Y	Double make/double break contacts, contact gap 1.4 mm	2 C/O DM/DB 	
Keying	Coil coding relay	Also order socket with keying	
Special options:			
M	$AgSnO_2$; “non-weldable” contacts, used for capacitive loads e.g. LED lighting	Icontact > 100 mA	E

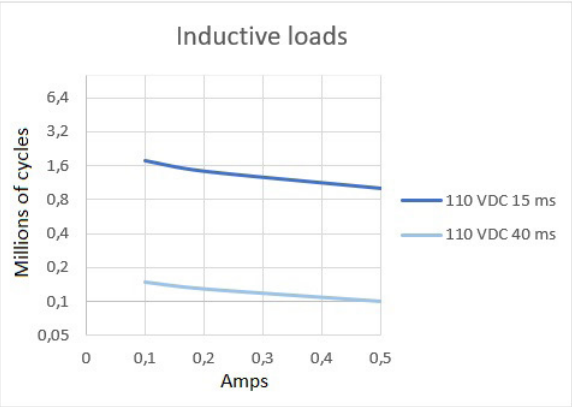
* Gold plated contacts characteristics	
Material	Ag, gold plated
Maximum switching voltage	60 V (higher voltages may be possible, contact Mors Smitt for more information)
Maximum switching current	400 mA (at higher rate gold will evaporate, then the standard silver contact rating of minimum 10 mA and 12 V is valid)
Minimum switching voltage	5 V
Minimum switching current	1 mA

Remark: For application support or technical product support, contact your local Mors Smitt sales office (see contact details on last page).

Electrical life expectancy







By connecting 2 contacts in series the DC current breaking capacity is increased by 50 %. Electrical lifetime is tested under laboratory conditions with switching frequency 0.33 Hz.

Note: The actual electrical lifetime in the application is affected by the switching frequency, type of contact (N/O or N/C), environmental conditions, etc.

For highly inductive loads Mors Smitt A400/B400 relays with standard double make double break contacts are the optimal solution.

Self-cleaning contacts

Each contact attracts organic molecules. When the surface is loaded with a voltage, like a relay contact, the attracting force is even higher. Therefore on each contact surface there is organic “pollution”.

Mors Smitt relays are designed to clean itself during switching of the contacts:

1. Mechanical wiping action: the “pollution” is swept aside.
   The movement of opposing contacts when they make contact: this wiping action cleans the surface of both contacts. Mors Smitt relays are designed for optimal wiping action: enough to clean the surface and not too much to prevent contact wear.
2. Electrical cleaning: the “pollution” is burnt away.
   A current at sufficient level will evaporate organic “pollution”. When switching loads (typically of a current >100 mA), the “pollution” is totally burnt away and a clean contact surface is available.

The result is a good contact between two opposing contacts without interference due to polluted contacts.

Voltage monitoring relay
CMVD4-U200N

Mounting possibilities/sockets

 V3	 V22BR	 V23	 V23BR	 V26
 V29	 V31	 V32	 V33	

Surface/wall mounting

338000302	V22BR	Screw socket, wall mount, front connection (9 mm terminals)
338000580	V23	Screw socket, wall mount, front connection (7.5 mm terminals)
338000610	V29	Spring clamp socket, wall mount, front dual connection (2.5 mm^2)

Rail mounting

338000580	V23	Screw socket, rail mount, front connection (7.5 mm terminals)
338000402	V23BR	Screw socket, rail mount, front connection (9 mm terminals)
338000610	V29	Spring clamp socket, rail mount, front dual connection (2.5 mm^2)

Panel/flush mounting

338100100	V3	Solder tag socket, panel mount, rear connection
328400100	V26	Crimp contact socket, panel mount, rear connection, A260 crimp contact
338000560	V31	Faston connection socket, rear dual connection (4.8 x 0.8 mm)
338000670	V33	Push-in terminal socket, panel mount, rear dual connection (3.3 mm^2)

PCB mounting

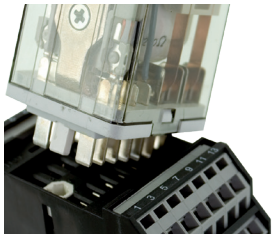
338000561	V32	PCB soldering socket

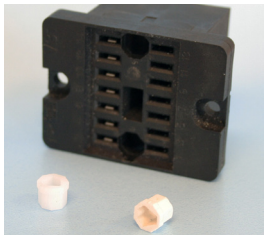
No external retaining clip needed as the ‘snap-lock’ will hold the relay into the socket under all circumstances and mounting directions (according shock & vibration requirements IEC 61373, Category I, Class B, Body mounted). If regulations require external retaining clips, these are available as well.

For more details see datasheets of the sockets on www.morssmitt.com

Voltage monitoring relay
CMVD4-U200N

Mechanical keying relay and socket (optional)





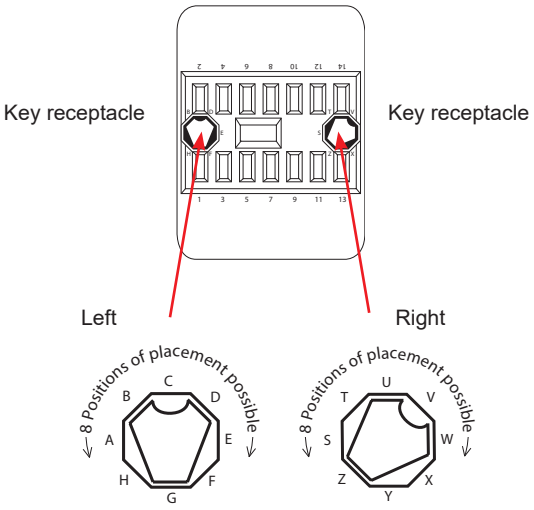
Function:
- To prevent wrong installation
- To prevent damage to equipment
- To prevent unsafe situations

Using keyed relays and sockets prevents a relay is inserted in a wrong socket. For example it prevents that a 24 VDC relay is put in a 110 VDC circuit. Positive discrimination is possible per different function, coil voltage, timing, monitoring, safety and non-safety.

The D relay socket keying option gives 8 x 8 = 64 possibilities. Upon ordering the customer simply indicates the need for the optional keying. Mors Smitt will assign a code to the relay and fix the pins into the relay. The sockets are supplied with loose key receptacles. Inserting the keys into the socket is very simple and self explaining.

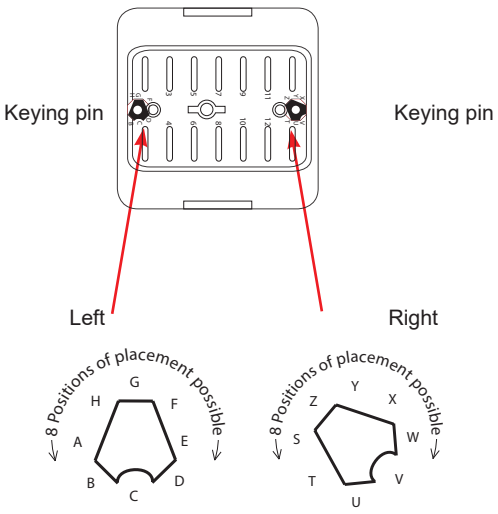
Remark: Sockets and relay shown are examples.

Top view socket



Example keying position G-Z on socket

Bottom view relay



Example keying position G-Z on relay

Keying codes

	Coil voltage code				
	U201N	U202N	U204N	U213N	U215N
Silver contacts (standard)	AS	AT	AV	AX	AY
Gold contacts (option E)	DT	HU	HV	HX	HY
Silver tin oxide (option M)	GT	GU	GW	GX	GY

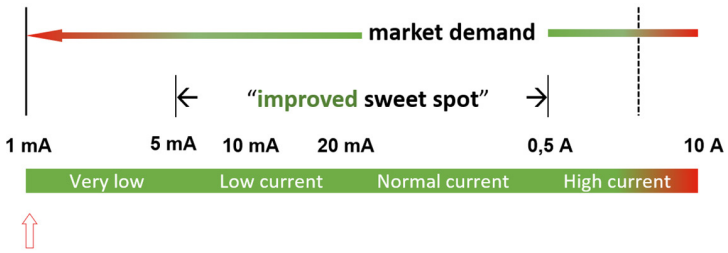
Voltage monitoring relay
CMVD4-U200N

Important for relay selection and operation

Make sure the relay is suitable for the application. For critical applications (for example: green loop applications) relays should be checked on correct working during periodic inspection.

Contact switching current

Each relay has a range of switching currents in which it performs optimally: the sweet spot. As switching currents are decreasing in field applications, the CMVD4-U200N relay has an improved sweet spot compared to its predecessors.



CMVD4-U200N with gold contacts

Recommendations for long time contact reliability

For relays to enable failure free performance over a very long operational time, it is important to create the right circumstances. In any relay, contact usage and atmospheric conditions influence the contact surface. To counter this effect it is common practice to use a safety factor of > 2 to ensure long time contact reliability.

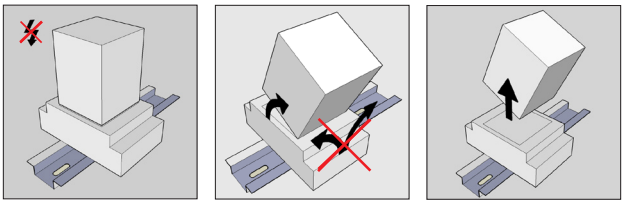
Therefore for long time contact reliability we recommend:
- Silver contacts: a minimum contact current of 20 mA per contact
- Gold contacts: a minimum contact current of 10 mA per contact
- Double Make Double Break contacts: a minimum contact current of 40 mA per contact
- When low currents are switched and not frequently, e.g. 10 mA once a day, it is advised next to gold plated contacts to put similar contacts within the same relay in parallel
- With higher load switching, e.g. 110 VDC and > 1 A, put relay contacts in series
- Rule of thumb: any relay works best with switching currents > 20 mA in DC environment when frequently switched. When not switched frequently a higher switching current like 50 mA is better for a long reliable operational time
- Check relays regularly, for example with the Mors Smitt Portable Relay Tester and visually through the transparent cover

Instructions for use

Installation

Before installation or working on the relay: disconnect the power supply first (no hot swapping)! Install socket and connect wiring according to the terminal identification. Plug relay into the socket ensuring there is no gap between the bottom of relay and the socket. Reverse installation into the socket is not possible due to the mechanical blocking snap-lock feature. Check to ensure that the coil connection polarity is not reversed. Relays can be mounted tightly together to save space. When rail mounting is used, always mount the socket in the direction of the UP arrow, to have proper fixation of the socket on the rail.Torque value screw to lock knob: 0.2-0.4 Nm.

Warning!
- Never use silicon in the proximity of the relays
- Do not use the relay in the presense of flammable gas as the arc generated from switching could cause ignition
- To remove relays from the socket, employ up and down lever movements. Sideway movement may cause damage to the coil wires



- Relays should never be swapped to other circuit positions when taken out of its socket for inspection or fault finding, always place it back into the original position to prevent contact resistance problems. Contact resistance problems can be created when swapping relays between different circuit loads due the contact wear/condition having changed during its operational life.

Operation

After installation always apply the rated voltage to the coil to check correct operation. Long term storage may corrode the silver on the relay pins. When plugging the relay into the socket, the female bifurcated or trifurcated receivers will automatically cut through the corrosion on the pins and guarantee a reliable connection.

Before actual use of relays, it is advised to switch the load several times with the contacts. The contacts will both be electrically and mechanically cleaned due to the positive wiping action. Sometimes a contact can build up increased contact resistance (≤ 15 mΩ when new). When using silver contacts one can clean the contact by switching a contact load a few times using >24 VDC & ~ 2A. Increased contact resistance is not always problematic, as it depends on circuit conditions. In general a contact resistance of 1 Ω is no problem, consult Mors Smitt for more information.

Condensation in the relay is possible when the coil is energised (warm) and the outside, environmental temperature is cold. This is a normal phenomenon and will not affect the function of the relay. Materials in the relay have no hygroscopic properties.

Inspection / maintenance

Correct operation of the relay can easily be checked as the transparent cover provides good visibility of the moving contacts. If the relay does not seem to operate correctly, check for presence of the appropriate coil voltage and polarity using a suitable multimeter. If a LED is fitted, it indicates voltage presence to the coil. If coil voltage is present, but the relay does not operate, a short circuit of the suppression diode is possible (This may have been reversed due to the coil connection).

Relays can easily be tested with the Mors Smitt Relay Tester. More information on: www.morssmitt.com.

If the relay doesn't work after inspection, replace the relay unit with a similar model. Do not attempt to open the relay cover or try to repair. Contacts are calibrated and in balance, touching can affect proper operation. Also resoldering may affect correct operation. Since 2009 relays have tamper proof seals fitted and once broken, warranty is void.

Most relay defects are caused by installation faults such as overvoltage, spikes/transients, high/short current far exceeding the relay specifications. When returning the relays for investigation, please provide all information on the RMA form. Send defective relays back to the manufacturer for repair or replacement. Normal wear and tear or external causes are excluded from warranty.

RMA procedure see www.morssmitt.com
